                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatotropic, antagonist, transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                              Gaps

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY2245-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                       Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor, liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y9131 represent examples of the peptides of the invention The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synchesis in liver cells and inhibitors of stimulation of collagen synchesis in liver cells and inhibitors be synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimeropes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition, collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope, cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                     Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and inhibitors of synthesis of proteclytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides A4Y92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatotropic, antagonist, transforming growth factor betal, TGF-b1, competitive inhibition; collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor; mimetope, cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AMY29245-Y39133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of protecolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                           Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

      The present sequence is an isolated peptide that was tested for its ability to modulate the function of CD66 family polypeptides and CD66 isgands. 106 sequences of 13 or 14 amino acids in length, and their analogues, were identified that modulate the function of at least one logomes, were identified that modulate the function of at least one cD66 family polypeptide and/or at least one ligand of the polypeptide. The peptides are capable of modulating activation of neutrophils, activation or inhibition, proliferation and/or differentiation of T-cells, B-cells, NK cells, LAK cells, dendritic cells, or other immune system cells, proliferation and/or differentiation of Epithelial cells, homotypic and/or heterotypic adhesion among CD66 family polypeptides are useful for delivering a therapeutically active agent to a patient, for modifying the metastasis of malianat cells, for altering bacterial or viral binding to cells or mainterial, for altering angiogenesis by contacting andothelial cells, tumoures, for detecting inflammation, for altering endothelial cells, tumour cells or immune cells, for altering angiogenesis by contacting endothelial cells, tumour cells or immune cells, for altering an immune response, and for altering keratinocyte proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel peptides useful for activating neutrophils or blocking activation of neutrophils, modulating homotypic or heterotypic adhesion of Cp66 polypeptides, and modulating immune cell activation.
                                                                                  CD66; CEACAM; adhesion molecule; antiviral; antibacterial; antiinflammatory; cytostatic; neutrophil activation; proliferation; differentiation; cancer; angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Page 54; 102pp; English.

25-MAR-2003 27-NOV-1991 AAR13972;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed constant of the constant of New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess 9 43.7%; Score 31; DB 4; Length 21; 42.1%; Pred. ```
The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-131 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) - (c); or (e) a nucleic acid encoding the polypeptide of (a) - (l) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection;
                                                                                                                                                                                  The invention relates to a solid phase peptide synthesis method using a support consisting of a functionalised polystyrene-grafted polymer substrate. The peptides are prepared in high yield and purity. The process may be used for compartmentalised synthesis of a number of different peptides in parallel. The present sequence is one of 13 melittin. (7-21) analogues prepared in parallel by the process (AAR61460-R61470)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                            grafted with polystyrene - used in peptide synthesis giving
                                                                                                                                                                                                                                                                                                                                                                              Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protected melittin-(7-21) and twelve analogs (AAR13969-79) derived by substitutions in position 12 and 14 were each assembled stepwise on a labelled sheet. The sheet was an aminomethylated 2BS$ polystyrenegrated polyethylene sheet labelled by graphite-based ink. The common steps of deprotection, neutralisation, washing and coupling of identical swins acids were performed simultaneously in a single reaction vessel, while the coupling of different amino acids was carried out in separate vessels. The polymer substrate serves as an efficient solid-phase carrier on which the peptide may be synthesised or attached and remain covalently bound in a stable, permanent manner. The resulting support can be used in solid-phase bioassays, esp. immunoassays. See also AAR13968-79. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) c(b) a nucleic acid encoding the polypeptide of (a)-(d); (I) has virucide and cytostatic activities, only be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, GAGE-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral
invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.

(T) has vincide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                              epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, GAGE-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Disclosure; Page 33; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth. (TGF) factor betal (TGF-b) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; I kappa B kinase inhibitor 37.40; recombinant production; gene therapy; cancer; tumour; angiocardiopathy; cardiovascular disorder; neurological disorder; immune disorder; inflammatory condition; cytostatic; antiinflammatory; immunomodulator; N-terminal peptide; enzyme linked immunosorbent assay; ELISA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGP-1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGP-b1 and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                              Hepatotropic, antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

The invention relates to an avian pancreatic polypeptide, modified by substitution of at least one amino acid residue, where the residue is being exposed on the alpha helix domain of the polypeptide when the polypeptide is in a tertiary form. The polypeptide is useful for screening drugs to identify agents capable of binding to the same binding site as the avian pancreatic polypeptide. It is also useful for diagnostic purposes to identify the presence and/or detect the lavels of DNA or protein that binds to the polypeptide, in treatment of diseases associated with the presence of a particular DNA or protein, where the polypeptide can be used to bind to DNA to promote or inhibit transcription and for identifying binding partners. The present sequence is that of a miniature protein and another molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Collection of capture compounds capable of binding to biomolecules to form complexes that are stable under mass spectrometry conditions, useful for analysis of biomolecules, especially proteins.
modification by substitution of an amino acid residue, that is exposed the alpha helix domain of the polypeptide is useful for screening for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          matrix assisted laser desorption ionisation-time of flight; MALDI-TOF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a collection of capture compounds capable of binding to biomolecules to form complexes that are stable under mass

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                       The invention relates to human I kappa B kinase inhibitor 37.40 (ABPS9974) and nucleic acids encoding it (ABZ70827). The protein has a molecular weight of 37.4 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic and the use of the protein, gene and antagonist in therapeutic pepplications. I kappa B kinase inhibitor 37.40 can be used in the treatment of a variety of diseases such as cancer, angiocardiopathy, neurological disorders, immune disorders and inflammatory conditions. The present sequence represents the 15 N-terminal amino acids of human I kappa B kinase inhibitor 37.40 used in ELISA (enzyme linked immunosorbent assay) in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Avian pancreatic polypeptide; alpha helix domain; modulate transcription; miniature protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptide scaffold e.g. an avian pancreatic polypeptide that comprises

spectrometry conditions. The formulae for the capture compounds comprises sets of compounds of formula (I)-(III) given in the specification. Also included are analysis of biomolecules (by contacting a composition comprising a biomolecule with the above collection and identifying or contacting a composition comprising a biomolecule with the above collection and identifying or contacting a composition comprising a biomolecule with the above collection and identifying or contacting the mixture with the above collection and identifying bound proteins), reducing diversity of a complex mixture of biomolecules (by contacting the mixture with the above collection and separating each set of complexes of capture compounds with biomolecules from the other comparing the patterns of biomolecules from a single subject into sets according to a phenotype, contacting mixtures of biomolecule from each set with the above collection and comparing the patterns of biomolecule binding from each set). The comparing the patterns of biomolecule binding from each set). The comparing the spectation (set) analysis of a proteome), using mass spectrometry, especially matrix assisted laser desorption ionisation company peptide light (MALDI-TOP) mass spectrometry. The present sequence is an exemplary peptide light may be incorporated into a capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 11 AA;

primary Tumour metastasis requires detachment of malignant cells from the primar tumour, penetration of blood or lymph vessels and attachment to the endothelium of distant organs, ultimately resulting in the formation of new tumours. The selectin family of adhesion molecules is implicated in this process. The selectin is a calcium-dependent molecule expressed by activated vascular endothelium. E-selectins bind to glycoconjugates Peptidomimetics of carbohydrate Lewis ligands useful for modulating inflammation, metastasis and angiogenesis. Claim 8; Page 58; 107pp; English.

The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessaing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention of treatment of HCV infection in a human. and Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell. carrying a terminal tetrasaccharide Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen is sialyl (SA)-Lea. The binding of selectin molecules to their ligands is thought to be an important step in metastasis. Therefore, inhibition of E-selectin-dependent carbohydrate-mediated interactions is thought to be a target for anti-cancer therapy. The present sequence is a Human Family II peptido-mimetic of E-selectin-SA-Lea binding. This sequence blocks E-selectin-SA-Lea binding and therefore blocks adhesion of tumour cells a leukocyces to endothelial cells and hence metastasis. This sequence is therefore an E-selectin antagonist Gaps HCV; hepatitis C virus; amphipathic helix; N-terminal; hepatotropic; non-structural protein; virucide; gene therapy; immunological; NS5A; ; 0 Length 12; Score 29; DB 3; Length 12; Pred. The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a buwan. The sequences shown in ABRO0555-BR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides
                                                                                                                                                                                                                             ö
The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural protein NSSA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.

```
The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglopoiethin, apoptools related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cycrokinos, kinasias, cytokinos, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptide encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with in agentic component, such as autoimmune diseases (e.g. rheumatoid arthuity, authityle sclerosis, diabetes, systemic lupus erythromatosus arthuitis, multiple sclerosis, diabetes, systemic lupus erythromatosus brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms
                                                                                                                                                                                                    Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; deuroportoctive; antiinficobial; gene therapy; vaccine; amylase; cancer; amyloid protein; andiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinasin; cytokine; interferon; interleukin; G-protein cyupled receptor; thioseterase; inflammation; multifactorial disease; autoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      37.7%; Score 29; DB 4; Length 14; 46.2%; Pred. ```
The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an C HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for creating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological cresponse against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to a novel method for identifying a compound useful C for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an C HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and chapatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological c reaponse against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides
                                                                                                                                                                                                                                                                                                                                                                       Identifying a compound for treating Hepatitis C virus (HCV) infection lassessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HCV; hepatitis C virus; amphipathic helix; N-terminal; hepatotropic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ል
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a compound for treating Hepatitis C virus (HCV) infection lassessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

XX

Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an myphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.

XX

Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an myphipathic helix present in the Nerminal region of an compound that interfere membranes of a eukaryotic coll, where a compound that interferes with the binding is useful for cell, where a compound that interferes with the binding is useful for cell, where a compounds that interferes with the binding is useful for creating the infection. The compounds of the invention have virucide, and choose and compounds are useful for treating Hepatitis C virus (HCV) creponse against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human.

CC infection. The composition is useful for treatment complementary peptides of varying lengths to the supplied are useful for the preparation of a composition of the supplied of the invention in a human.

"The structures of the frenatin peptides from the skin secretion of the giant tree frog Litoria infrafrenata.";

J. Pept. Sci. 2:117-114(1996).

-I- FUNCTION: Wide spectrum antimicrobial peptide.

-I- SUBCELLULAR LOCATION: Secreted.

-I- TISSUE SPECIFICITY: Expressed by the skin parotoid and/or rostral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              glands.
